

## **BACKGROUND**

**Methodology:** The survey is based on online interviews with participants of the YouGov Panel Germany. The members of the panel have agreed to take part in surveys. At present the panel contains approximately 200,000 panellists, who are recruited and managed by Yougov in a variety of different ways.

The panellists are invited to the survey via an email with a link. The sample is drawn randomly from the base sample of the YouGov Panel Germany as per specification of the particular study. (The sample could be e.g. the "German population" or a subset such as "German women")

The YouGov Panel Germany has a high response rate of 35% to 65% which can vary depending on subject, complexity and length of the questionnaire. In addition to sampling quotas, the sample is weighted to ensure a nationally representative distribution. Concerning quota definition and weighting; we align ourselves to the data of micro-census (regarding the characteristics of age, gender and region). All results are based on a random sample and comply with the requirements of the calculation of statistical parameters and tests.

For further information to the results in this table, please contact YouGov on +49 (0) 221 420 61 0 or send an email to [omnibus@yougov.de](mailto:omnibus@yougov.de) indicating the relevant survey.

### **Information about publication**

The interpretation of survey results can contain pitfalls. Results of subsamples with less than 100 respondents do not represent a wide enough cross-section of the target population to be considered statistically reliable. This can result in wasteful queries or the need of revising your publication. YouGov wants to support you on basing your publication on statistically reliable data, which withstand critical inquiries. Therefore we ask you to send us every publication based on data collected by YouGov for examination and release. We don't make any redactional changes to your publication, but only check that the correct data is being used.

The examination and approval of data for publication can take up to 48 hours and is part of our general terms and conditions. We ask for your understanding during this process and if you don't have sufficient time, please tell us in advance. When due notice is given, it may be possible to approve your data for publication in a shorter time period.

If you refer to data examined and released by us in your publication, please indicate this at the end of your publication with the following reference: "Unless otherwise stated, all data are provided by YouGov Deutschland GmbH. 8.826 respondents participated in the survey, which took place between the 27.11. and the 06.12.2020. The results were weighted and are representative for the population of the respective countries (age 18+).

To make sure that all respondents got the same information we have added the following introduction: Gene Drive is a method of genetic engineering designed to either replace wild populations or species with genetically engineered types (GMOs) or to eradicate them completely. Some scientists are convinced that this technology is a potential solution to various challenges (diseases, invasive species, agricultural pests). They want to test it in nature to see whether it will deliver the promised benefits.

Other scientists warn of possible grave and even irreversible consequences for ecosystems, biodiversity, human health, agricultural systems or peace. They believe that once released, Gene Drive Organisms may be difficult to control or to retrieve and could permanently harm ecosystems.

Field time: 01. - 02.12.2020

Gene Drive is a method of genetic engineering designed to either replace wild populations or species with genetically engineered types (GMOs) or to eradicate them completely. Some scientists are convinced that this technology is a potential solution to various challenges (diseases, invasive species, agricultural pests). They want to test it in nature to see whether it will deliver the promised benefits. Other scientists warn of possible grave and even irreversible consequences for ecosystems, biodiversity, human health, agricultural systems or peace. They believe that once released, Gene Drive Organisms may be difficult to control or to retrieve and could permanently harm ecosystems.

**Should humanity release genetically engineered Gene Drive Organisms into nature?**

Gene Drive  
Organisms**

Sample size: 1048

Field time: 27.11. -  
05.12.2020

Gene Drive is a method of genetic engineering designed to either replace wild populations or species with genetically engineered types (GMOs) or to eradicate them completely.

Some scientists are convinced that this technology is a potential solution to various challenges (diseases, invasive species, agricultural pests). They want to test it in nature to see whether it will deliver the promised benefits.

Other scientists warn of possible grave and even irreversible consequences for ecosystems, biodiversity, human health, agricultural systems or peace. They believe that once released, Gene Drive Organisms may be difficult to control or to retrieve and could permanently harm ecosystems.

**Should humanity release genetically engineered Gene Drive Organisms into nature?**

To what extent to you agree or disagree with the following statement: For Gene Drives that are designed to spread globally or have the potential to accidentally spread globally a global consensus should be required before any authorisation can be given to release Gene Drive Organisms the environment.
